## Fuse studio login

Sign in (active tab) Have you forgotten your password? Welcome to The Fuse Dance Center! Powered by: DanceStudio-Pro.com return to the top © 2020 Fusion Dance Center take UX Authoring to the next level with Fuse Studio. A hierarchical overview of your app makes the planning structure and project easier. You can easily add items in your app and pinch them with visual tools. Preview different cases and pages at the same time to see how changes affect the entire application. The dashboard when you start Fuse is the first thing we are presented with the dashboard. From there we can create new projects, open recent projects, or jump directly into lessons and documents. The workspace is called the area that contains our preview viewports workspace. Here we can also find the log window. In the workspace we can sort as many preview ports as we need, and configure them in different sizes and aspects. The hierarchy view shows us that the hierarchy displays the structure of the application. Each element in the hierarchy view corresponds to an item in the UX encoding. The selected item is also highlighted by a blue rectangle in the preview view window. We can rearrange items by dragging them around in the hierarchy view, removing them by right-clicking and selecting the option to remove the item. Locating the right editor clicks an item and clicking select a location in the editor will go to the correct file and font within your text editor. Note: Select a site in an editor that works with corn and sublime additives. The editor should be open to let us edit the right-click button that clicks on an item to edit the class definition as long as it is defined in the current project. The hierarchy view then changes the context to show the structure of the class that we edit. To return to the app context, click the Back to App button above the hierarchy view. The toolbox lists the components of the core valves. This includes all the most important panel types, such as StackPanel and Grid, as well as some basic shapes, text, image and input controls. These can be pulled and dropped in the hierarchy view. While dragging items into the hierarchy view, a blue line appears to indicate where the item is placed in the hierarchy. Your categories in your categories section lists all the custom components that we have defined in our project using the ux:Class attribute. We can drag these into the perspective of our hierarchy, just as with the basic fuse components of the toolbox. Inspector Inspector displays information about the items in the app. Choosing an item, whether in the view port, displaying the hierarchy or by selecting it in the text editor (Atom or Sublime Text 3 with the installation of plugin valves), will fill the inspector with controls that allow us to tweak its various properties. The blue dot next to the tab head indicates that it Properties that have been changed to non-default values. The inspector has many expandable tabs, which contain controls that allow us to modify different aspects of an item. (This is also a good way to explore exactly what characteristics different elements have.) Compressed mode activates compressed mode, shrinks the entire frame to fit the basic preview view port. This allows us more easily to fit a preview view next to our text editor. This is very useful if one prefers to work with UX tags directly. Select mode you can enter the selection mode by clicking the selection switch button, at the top middle of the window. This lets you select the item by clicking on it directly in the preview view window. Before you reach the management controller, you must set up a username and password and start the Karaf controller. If you want to manage the properties of the fabric, you can create a texture from the Karaf controller. The valve management controller is available by default when the JBoss red hat valves are installed. After you start the Karaf controller, you can use the default URL to access the console locally or a custom URL to connect to a remote host. Before accessing the management controller, you must configure user credentials, start JBoss Fuse, and configure user credentials. If you're using JBoss Fuse on OpenShift, you can skip this task and access the management console directly with the JBoss Fuse URL after you deploy the JBoss Fuse cartridge. For more information on how to start using JBoss Fuse on OpenShift, see Cloud Computing Fabric. To configure user credentials and start JBoss Fuse: In the command line, go to the directory that you installed JBoss Fuse and run the following command: ./fuse Karaf controller starts and shows release information, default controller URL, and common command list. If there is no User for JBoss Fuse, turn on the esb:create-admin-user command to create a user. You can also identify your username and password directly in the users.properties file. For more information, see the red hat fuse installation manual. Access the Fuse management controller from a web browser. For a list of approved browsers, see access.redhat.com. To access the management controller: In a web browser, enter the URL to connect to the management controller in the following format: &lt;host\_name&gt;http://&lt;port\_number&gt;; for example, use the following default URL to connect to the management controller locally: you can configure a pax-web property to support HTTPS connections for a particular container. On the sign-in page, enter your username and password and click Sign in. If you create or join a fabric, the management controller opens up to the fabric perspective. Otherwise, only the container perspective is available. By default, the management controller displays the welcome page. You can choose to hide the welcome page at the bottom of the page. Page. &lt;/port\_number&gt;&lt;/host\_name&gt;
